

Project 2 Design Document

Timothy Criss Jr & Priamos Koumas

Professor Guerra

CS 5610

June 19, 2026

Project Description:

- The goal of Project 2 is to design a simple yet effective and impactful application that incorporates a wide range of technologies, including Node, Express, Mongo, and HTML5. The team has decided to take a unique approach to this project, specifically, the healthcare route. By taking this healthcare path, the mission is to attack a specific area within this space, a disease that has affected millions for the worse: cancer. The idea is to build a search platform that helps users better understand the treatments and testing taking place in trials. The platform will provide users with information such as the type of cancer, phase, status, and trial location. It is important to educate users with straightforward, accurate information and to describe the current status of the different treatments being examined.

User Stories:

- As a parent of a child suffering from cancer, I want to be able to see if there are any treatments being developed, specific to what my child may have.
- As a cancer researcher, I want to make sure I am not replicating types of development that have taken place or are currently taking place.
- As a student studying pre-med, I want to be able to identify trials taking place nearby in order to reach-out and partake in these practices.

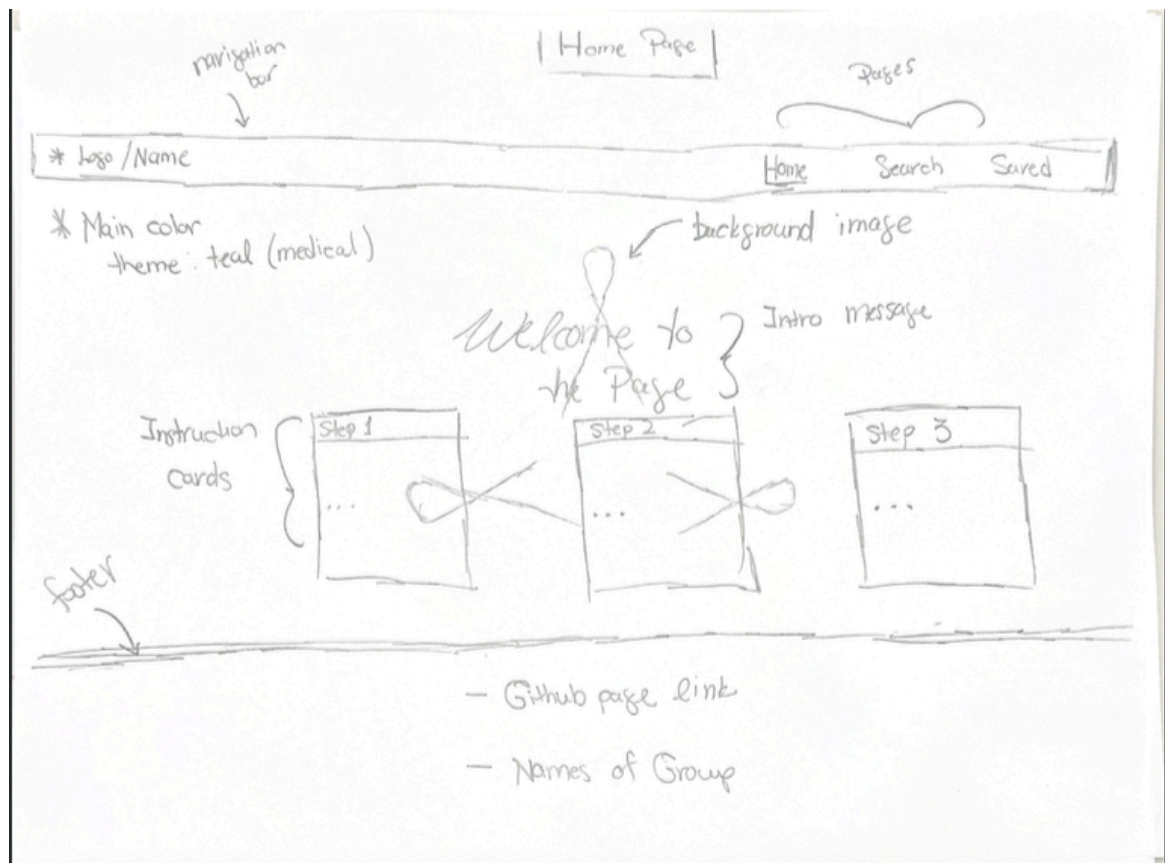

User Personas:

- Mother of cancer patient, Stacy
 - Demographic: 41 year old, lives in Seattle, Washington in a married household
 - Role/Goal: Determine if there is treatment development taking place related to their child's cancer and what phase it is in, and see if they can be potentially treated with this process
 - Frustration: Unfortunately cannot find the correct medical process to help treat their child, and does not know where to take them to receive it
 - Needs: To find a treatment that is in place and has ability to be used on their child in order to help fight their battle against their cancer
- Cancer researcher, Daniel
 - Demographic: 64 year old, lives in Houston, Texas, single household

- Role/Goal: Discover the types of cancer treatment trials taking place, examine exactly what is being tested, and where
- Frustration: Unable to come up with new research ideas to pursue, since they have been studying a variety of concepts the last 25 years.
- Needs: Needs to find inspiration and determine what type of research they have the ability to take part in, and how to potentially initiate variations of the research that is already taking place
- Premed Student, John-Paul
 - Demographic: 25 year old, lives in Pittsburgh, Pennsylvania, in a single household
 - Role/Goal: Pursue areas of interest while on premed path, and determine what steps can be taken in order to take advantage of their opportunity
 - Frustration: Unaware of potential trials taking place near their area, and who to contact if they have interest
 - Needs: To improve researching skills while completing their degree in premed, and better understand what topics they may have concrete interest in
